Grounding transformers are typically used to:

Provide a relatively low-impedance path to ground, thereby maintaining the

system neutral at or near ground potential. Limit the magnitude of

transient overvoltages when restriking ground faults occur. Provide a source of

ground fault current during line-to-ground faults.

Sensing Resistors are attached in parallel to the Neutral Grounding Resistor.

The sensing resistor allows a protective relay which detects resistor failure in a continuous manner.

Sensing Resistors are used in combination with neutral grounding resistor monitor relays.

Sensing Resistors (Resistive Vo) $T_j T^* BT / F$
